DETAILED ACTION

Claim Rejections - 35 USC § 103

The following is a quotation of 35 U.S.C. 103(a) which forms the basis for all obviousness rejections set forth in this Office action:

(a) A patent may not be obtained though the invention is not identically disclosed or described as set forth in section 102 of this title, if the differences between the subject matter sought to be patented and the prior art are such that the subject matter as a whole would have been obvious at the time the invention was made to a person having ordinary skill in the art to which said subject matter pertains. Patentability shall not be negated by the manner in which the invention was made.

Claims 5-20 are rejected under 35 U.S.C. 103(a) as being unpatentable over Tao et al. (US 6,191,360) in combination with Lowry (US 6,457,506).

Tao disclose method for assembling an IC package comprising inherently applying an epoxy (39) that is inherently a conductive filler to a resin (via *applicant's* claim 18) to an integrated circuit, inherently placing a heat spreader, thermal element (37) adjacent to the epoxy and inherently attaching solder balls (not labeled) to a substrate (30), further comprising molding an encapsulant (33b) onto the substrate and the IC, and curing the epoxy.

Tao does not appear to explicitly disclose curing with an energy at a microwave frequency.

However, Lowry utilizes curing an epoxy with energy at a microwave frequency (Col. 5, Line 15) via an inherent microwave generator that inherently comprises baking the substrate before curing the epoxy (via heating package results in a bake) and selecting a frequency to cure epoxy without damaging IC, wherein the microwave generator is directed toward the epoxy.

It would have been obvious to one of ordinary skill in the art to utilize energy at a microwave frequency with the epoxy of Tao et al. in order to cure an encapsulant as taught by Tao (Col. 3, Lines 17-18).
